## **Creating a Spring Security Project**

To start a basic Spring Security project:

## **Controller Setup:**

```
package com.spring.security.controller;
import org.springframework.web.bind.annotation.GetMapping;
import org.springframework.web.bind.annotation.RestController;

@RestController
public class HelloController {
    @GetMapping("/hello")
    public String greet() {
        return "Hello World";
    }
}
```

## **Initial Behavior:**

o By default, any user can access this endpoint without restrictions.

Illustrate the default access with an image showing a successful "/hello" endpoint call.

• **Next Step**: To secure this endpoint so that only authenticated users can access it, enable Spring Security.
