## **Input Validation Using Around Advice**

> Task: Validate method input.

## **Example:**

```
@Component
@Aspect
public class ValidationAspect {
    public static final Logger LOGGER=
        LoggerFactory.getLogger(ValidationAspect.class);

@Around("execution (*com.telusko.springbootrest.service.JobService.getJob(..)) && args(postId)")
public Object validateAndUpdate(ProceedingJoinPoint jp,int postId) throws Throwable {
        if (postId<0) {
            LOGGER.info("PostId is negative, updating it");
            postId=-postId;
            LOGGER.info("new Value "+postId);
        }
        Object obj=jp.proceed(new Object[] {postId});
        return obj;
    }
}</pre>
```

## **Explanation:**

• The && args(posId) expression ensures the advice runs only if posId is passed as an argument.
