# Before Advice

**Annotations:**
- ➤ @Before: Executes advice before the matched method runs.
- ➤ Annotation Used: @Before("pointcut expression")

**Expression Example:**

```java
@Component
@Aspect
public class LoggingAspect{

    private static final Logger LOGGER =
        LoggerFactory.getLogger(LoggingAspect.class);

    @Before("execution (* com.telusko.springbootrest.service.JobService.*(..))")
    public void logMethodCall() {
        LOGGER.info("Method Called ");
    }
}
```

- ● **Explanation**:
  - ○ This allows logging or performing actions before method executions without modifying the target method (JobService).
